The Max-Cut Problem

A MAXIMUM CUT $\delta(Q)$ in a (weighted) graph G = (V, E) is a node set $Q \subseteq V$ with maximum weight $w(\delta(Q)) = \sum_{e \in \delta(Q)} w(e)$.

The Max-Cut Problem

Complexity Status

- NP-hard in general
- poly-time solvable graph classes exist, e.g. planar graphs

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

General Algorithmic Scheme

Input: embedding of a weighted planar graph *G* **Output:** MAX-CUT $\delta(Q)$ of *G*

- 1: Construct some expanded dual graph G_D
- 2: Calculate matching M in G_D
- 3: Use *M* to generate a MAX-CUT $\delta(Q)$ of *G*

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ のので

4: return $\delta(Q)$

- merge multiple edges to one edge
- Let G = (V, E) be
 - simple
 - connected
 - planar
 - real-weighted

Create Dual

▶ take dual edge weights from G

planar graph (assume $w(e) = 1 \ \forall e \in E$)

Create Dual

take dual edge weights from G

embedding of a simple planar graph (assume $w(e) = 1 \ \forall e \in E$)

Split Nodes

Split each node $v \in V_D$ with deg(v) > 4 into $\lfloor (deg(v) - 1)/2 \rfloor$ nodes, connect them by a simple path. New edges receive weight zero.

even degree node

odd degree node

Correctness

- ⇒ optimal matching
- ⇔ optimal Eulerian subgraphs
- ⇔ optimal cut

Correctness

- ⇒ optimal matching
- ⇔ optimal Eulerian subgraphs
- ⇔ optimal cut

Correctness

- ⇒ optimal matching
- ⇔ optimal Eulerian subgraphs
- ⇔ optimal cut

Correctness

- ⇒ optimal matching
- ⇔ optimal Eulerian subgraphs
- ⇔ optimal cut

transformation can be done in linear time \Rightarrow running time depends on the matching: $O(n^{1.5} logn)$ (with Planar Separator Theorem)
